NASAL STRIPS VS NOSEFLOW

~~Sticky strips.~~ Meet your upgrade.

15 attack scripts targeting everything wrong with nasal strips — falling off, single-use waste, surface-level fix, adhesive skin damage. Position NoseFlow as the obvious evolution.

CATEGORY	Nasal Strips	NoseFlow
HOW IT WORKS	Pulls outside of nose outward	Opens nasal valve from inside — where restriction actually is
STAYS ON ALL NIGHT	Falls off by 2–3am, especially if sweating	Stays in place all night, every night
COST OVER TIME	Single-use — $1–2 per night = $365–$730/year	Reusable — $14.95 lasts weeks
SKIN IMPACT	Adhesive causes redness, irritation, hair removal	No adhesive. Zero skin contact on face.
CLINICAL EVIDENCE	Limited — works on outer nose only	Internal dilators outperform strips in sleep quality studies
ENVIRONMENTAL WASTE	365+ plastic strips per year in landfill	One reusable device. Minimal waste.
TRAVEL FRIENDLY	Bulky box, runs out, TSA questions	Pocket-sized case. Goes anywhere.

15 ATTACK SCRIPTS — USE THESE TO OWN THE CATEGORY

All 15 | Falls Off | Cost / Waste | Science | Skin Damage | 😂 Funny | ⚡ Punchy

SCRIPT #01 — FALLS OFF · PUNCHY · 15–30S
3am Strip Report

HOOK
"Your nasal strip fell off at 2:47am. You snored until 6. Thanks for nothing."

SCRIPT
Nasal strips are held on by adhesive. Sweat, movement, skin oils — they all break that bond. By the middle of the night when you need it most, it's on your pillow. NoseFlow sits inside your nose. Nothing to stick. Nothing to fall off. Works all night because it physically can't go anywhere.

📹 VISUAL DIRECTION
Film a nasal strip slowly peeling off a surface. Cut to NoseFlow staying firmly in place.

📲🔗 **Link in bio. Stays in. All night.**

SCRIPT #02 — FALLS OFF · FUNNY · 15–30S
The 3am Discovery

HOOK
"Rate of nasal strips actually staying on all night: 0%. Rate of finding them stuck to your pillow: 100%."

SCRIPT
I've done the research personally. Multiple years of data. The strip always ends up somewhere it's not supposed to be. On your pillow. On your partner. On the cat somehow. NoseFlow goes inside. There's nowhere for it to go except where you put it.

📹 VISUAL DIRECTION
Show yourself picking a nasal strip off a pillow with a 'seriously?' expression. Hold up NoseFlow. Shrug.

📲🔗 **Link in bio. No more morning strip archaeology.**

SCRIPT #03 — FALLS OFF · CASUAL · 15–30S
Hot Sleepers Know

HOOK
"If you're a hot sleeper or you sweat at night — nasal strips are completely useless for you."

SCRIPT
Strips rely on adhesive. Moisture destroys adhesive. If you run warm at night, sweat even slightly, or sleep in a humid room — that strip is coming off within the first hour. I switched to NoseFlow because it has nothing to do with adhesive. It sits inside and stays there regardless of how warm you sleep.

📹 VISUAL DIRECTION
On camera, casual talking-head style. Hold up both products.

📲🔗 **Link in bio.**

SCRIPT #04 — COST / WASTE · PUNCHY · 15
The Maths is Embarrassing

HOOK
"You're spending $500 a year on something that falls off at 2am."

SCRIPT
One nasal strip: $1.50. One year of nightly use: $547. And it doesn't even stay on. NoseFlow: $14.95. Reusable for weeks. That's it. That's the whole comparison. The strip industry is one of the greatest recurring revenue scams in the wellness space and they're counting on you not doing this maths.

📹 VISUAL DIRECTION
Calculator on screen. Show the numbers. Then hold up NoseFlow next to a $14.95 price tag.

📲🔗 **Link in bio. Do the maths.**

SCRIPT #05 — COST / WASTE · EDUCATIONAL
The Subscription You Never Signed Up For

HOOK
"Nasal strips are a subscription product disguised as a solution."

SCRIPT
Every night you use one, you throw one away and need to buy another. The companies selling them have zero incentive to give you something that lasts — their entire business model depends on daily consumption. Reusable nasal dilators like NoseFlow exist precisely because the technology works better AND lasts longer. You pay once. You wash it. You reuse it. The strip industry knows this, which is why you don't see internal dilators in supermarkets next to the Breathe Right boxes.

📹 VISUAL DIRECTION
Show a full box of strips, count them, calculate cost. Then hold up NoseFlow.

📲🔗 **Link in bio. Buy once. Breathe better.**

SCRIPT #06 — COST / WASTE · FUNNY · 15–30S
Breathe Right, Spend Wrong

HOOK
"Breathe Right. Spend Wrong."

SCRIPT
Their strips cost about $1.50 each. Use one a night. That's $547 a year. For a piece of plastic that sticks to the outside of your nose and — plot twist — falls off before you hit REM sleep. NoseFlow is $14.95 and it physically cannot fall off because it's inside your nose. One of these is a smart purchase. The other is basically a donation to a large corporation.

📹 VISUAL DIRECTION
Side-by-side shot. Box of strips with annual cost. NoseFlow with its price. Let the image speak.

SCRIPT #07 — SCIENCE · EDUCATIONAL · 30–60S
Outside vs Inside — The Anatomy Lesson

HOOK
"Nasal strips work on the outside of your nose. The problem is on the inside."

SCRIPT
The nasal valve — the narrowest point of your airway — sits about 1.5cm inside your nostril. That's where up to 50% of total nasal airway resistance comes from. Nasal strips apply force to the alar cartilage on the outside of your nose, which has an indirect and limited effect on the valve. Internal nasal dilators apply outward pressure directly to the nasal valve itself. A 2019 study in Acta Biomedica confirmed internal dilators produce better sleep quality outcomes and higher patient satisfaction than external strips. You're not buying a brand. You're buying the mechanism that actually works.

📹 VISUAL DIRECTION
Simple diagram showing nasal anatomy — nasal valve location vs where strips apply pressure.

📲🔗 **NoseFlow. Fix it from inside. Link in bio.**

SCRIPT #08 — SCIENCE · PUNCHY · 15–30S
A Study Compared Them

HOOK
"A clinical study directly compared nasal strips and internal dilators. Internal won."

SCRIPT
Acta Biomedica, 2019. Internal nasal dilators vs Breathe Right strips in snoring patients. Internal dilators: better sleep quality scores, more effective in more patients, higher satisfaction. External strips: weaker effect, limited to patients with specific outer nose flexibility. The science isn't ambiguous. NoseFlow works where the restriction actually is.

📹 VISUAL DIRECTION
Text on screen with study name. Punchy cuts.

SCRIPT #09 — SCIENCE · CASUAL · 30–60S
I Looked Up the Research

HOOK
"I got curious about why strips never felt like they were doing much. So I looked up the research."

SCRIPT
Turns out there's a reason. Strips work on the outer nose — the cartilage on the side. But your actual breathing restriction happens at the nasal valve, which is inside. It's like trying to unblock a drain by rubbing the outside of the pipe. Internal dilators go to the source. When I switched from strips to NoseFlow the difference was immediately obvious — more airflow, and it actually stayed in all night.

📹 VISUAL DIRECTION
Casual talking head. Maybe show the anatomy on your phone screen.

📲🔗 **Link in bio if you want to try the one that actually works.**

SCRIPT #10 — SKIN DAMAGE · PUNCHY · 15–30S
What That Adhesive Is Doing to Your Skin

HOOK
"Nasal strips leave your skin red, irritated, and slowly damage it over time. Every night."

SCRIPT
The adhesive on nasal strips is medical-grade but it's still daily mechanical stress on the thin skin of your nose bridge. Redness, sensitivity, occasional tearing of skin — all documented side effects of long-term strip use. NoseFlow has zero contact with your face. It's inside your nose, held in place by the nasal walls, no adhesive required. Your skin will thank you.

📹 VISUAL DIRECTION
Close-up of redness after strip removal. Then NoseFlow — no marks, no irritation.

📲🔗 **Link in bio.**

TikTok · Reels · Copy

SCRIPT #11 — SKIN DAMAGE · CASUAL · 15–30S
The Morning Rip

HOOK
"Anyone else rip a nasal strip off in the morning and immediately regret it?"

SCRIPT
The adhesive gets stronger overnight. What went on gently at 10pm is basically welded on by 7am. You're ripping skin cells off your nose bridge every single morning. For some people that means permanent redness and thinning skin over time. I switched to NoseFlow partly for this reason — nothing on my face, nothing to rip off, no morning pain ritual.

📹 VISUAL DIRECTION
On camera. Relatable, slightly wincing expression at the memory.

📲🔗 **Link in bio.**

TikTok · Facebook · Copy

SCRIPT #12 — SKIN DAMAGE · FUNNY · 15–30S
The Morning Wax

HOOK
"Nasal strips are basically a free nose bridge wax every morning. Except it's not free. And it hurts."

SCRIPT
You pay $1.50 to slowly exfoliate your nose bridge while you sleep and then yank it off in the morning. Truly the luxury experience. NoseFlow goes inside. You take it out like an earring. Zero pain. Zero red marks. Zero regretting your life choices.

📹 VISUAL DIRECTION
Comedic reaction face. Slow-mo strip removal with a pained expression. Cut to gentle NoseFlow removal. Smile.

📲🔗 **Link in bio. Painless breathing.**

SCRIPT #13 — FALLS OFF · PUNCHY · 15–30S
Humidity Test

HOOK
"I want to show you something. [Stick a nasal strip on your arm. Pour a small amount of water on it. Watch it peel.]"

SCRIPT
That's what happens when you sweat at night. The adhesive fails. The strip falls off. You breathe through your mouth. You snore. You wake up tired. NoseFlow sits inside your nasal cavity. Water doesn't affect it. Movement doesn't affect it. It stays exactly where you put it until you take it out.

📹 VISUAL DIRECTION
On-camera demo: strip on arm, water poured, strip peels. Then NoseFlow demo — no adhesive, stays in.

SCRIPT #14 — COST / WASTE · CASUAL · 30–60S
Switch and Never Go Back

HOOK
"I used nasal strips for three years before someone told me I was doing it the hard way."

SCRIPT
Three years. $500 in strips. Picking them off my pillow every morning. Redness on my nose. And they still fell off most nights. A friend showed me internal nasal dilators and I genuinely felt stupid for not knowing they existed. NoseFlow is $14.95. It lasts for weeks. It doesn't fall off. It works better. If I'd found this three years ago I'd have saved money, slept better, and had nicer skin. Learn from my expensive mistake.

📹 VISUAL DIRECTION
Talking head. Genuine, slightly self-deprecating tone.

SCRIPT #15 — SCIENCE · PUNCHY · 15–30S
The Upgrade Is Real

HOOK
"Nasal strips were invented in 1993. It's been 30 years. There's a better way now."

SCRIPT
External nasal strips were a genuine innovation in 1993. But medicine moved on. Internal nasal dilators apply force directly to the nasal valve — the actual source of restriction. Better clinical outcomes. No adhesive. Reusable. The only reason strips still dominate shelf space is supermarket inertia and brand spending. NoseFlow is what the science actually recommends.

📹 VISUAL DIRECTION
Text: 'Nasal strips: 1993 technology.' Cut to NoseFlow. Text: 'The upgrade.'
